

Hiring challenge

Congratulations!

You are here because we think you could be a good fit to join our team here at Hubtype!

We're looking for someone who can both work within a team but also independently break down large tasks into manageable pieces, implement beautiful UI with precision, and know when to ask for help. We hope you're the person we're searching for!

About the challenge

Below, you'll find an exercise we've chosen to represent the work you may encounter in this role. There is no single right answer — we've left it intentionally open-ended to understand how you think. **We also promise personalized feedback for every submission.** Our goals with this challenge are to:

- Learn as much as we can about how you work.
- Require as little of your time as possible. By limiting this to two hours, we hope this is manageable with your busy schedule.
- Introduce you to the types of challenges you might encounter in this role.

We recommend spending no more than **120 minutes** working on this. If you find yourself going over this time limit, feel free to simply share what you would have done with extra time.

Goal:

Create a simple React application that allows users to search for Dragon Ball characters using the provided API. Users should be able to search by name and by selecting a base ki range.

Requirements:

1. Utilize the Dragon Ball API for fetching character data.
2. Implement a search functionality where users can enter the name of a character and see matching results. If a search matches several names it should display all of them. For example: "Bu" should show Bulma, Majin Buu.
3. Implement a search functionality where users can enter a base ki range and see matching results.
4. Display basic information about each character in the search results (name, image, description, ki).
5. Organize your code following best practices for React application structure.

Guidelines:

- You have a maximum of 120 minutes to complete the task.
- Please use React for the front-end.
- Use any additional libraries you find necessary.
- Focus on code quality, readability, and organization.
- Ensure error handling for API requests.
- Use Git for version control and commit your progress regularly.
- Once finished, provide clear instructions on how to run your application locally.

Resources:

- Dragon Ball API Documentation: <https://web.dragonball-api.com/documentation>
- Visual suggestions, not mandatory to follow them:

Dragon Ball character finder

Vegeta

25000

Regal, egotistical, and full of pride, Vegeta was once a ruthless, cold-blooded warrior and outright killer, but later abandoned his position in the Frieza Force for a peaceful life on Earth.

Son Goku

30000

▼

Bulma

35000

▼

Submission:

- Please provide a link to your Git repository containing the code.

Clarifications:

- Base ki is determined by the **ki** field.

Alternative

Alternatively, if you have a GitHub repo or other work that you think clearly demonstrates all the same skills even to those unfamiliar with the code base, feel free to send that to us instead. Since we're looking for more than just technical skills, it would be great to hear more about the project. For example, how you prioritized your time, what decision points you came to and what led you to the decisions you made, and maybe even a walk-through of one of the most technically challenging pieces you implemented.
